Challenges are a way to find out what we are made, they show us our strengths and weaknesses and once we know them, challenges let us not only have the opportunity to get it better at all, also they give us more experience making us be better, growing up our knowledge to face the next ones, defining us as developers as a people. Besides, the challenges are a good way to realize how good we are in our field and how far we can get. I'm a software engineer who is always learning and getting better his knowledge to face these challenges as the best way, being successful and offering quality and good performance. I am passionate about this career and I want to enhance every day. I am not afraid to dive into the unknown world because I am sure that I will learn how to do it and I will do it very well. Since I learned how to develop software, I realized about my abilities to learn new things and I want to use it for growing up as a developer. My favorite language is Javascript, I have worked with other languages like PHP and Python, but I have more experience with JS. Moreover, I have been working such as a full-stack developer with React Js and Node Js for a while. Also, I have worked with databases like Postgres, MySQL, Mongo DB, and real-time databases like Firebase. Also, I have knowledge in Gatsby, Strapi, GraphQL, that these ones give to web applications an incredible performance. Additionally, I know How to apply testing with React-Testing-Library and Cypress. Nowadays, I am in charge of giving technical support too, about the application that I am developing in my current company. Dealing with people is something that I have been doing since I started working in Agricola Industrial La Lydia.
